Eddie

A WhatsApp reply assistant and to-do list, for businesses and for people with no business at all.

Live app: https://eddie-wa.vercel.app

---

1. What Eddie is

Eddie answers the question every Nigerian business owner faces every day: the same five questions, sixty times, while serving a customer.

You fill your details in once. Eddie writes your WhatsApp messages for you, and answers your customers in your own words.

It also keeps your to-do list, because the person answering all those messages is the same person who has to restock, call the supplier and send the invoice.

2. Two ways to use it

- **Business mode.** Shop, service or practice. Business name, prices, payment and delivery rules. Customer-facing messages.
- **Personal mode.** No business needed. Name optional, prices and delivery fields disappear, and Eddie writes personal replies such as 'I will call you back shortly'.

A student, job seeker, freelancer, parent or volunteer can use Eddie without pretending to be a company.

3. How it works

- **Step 1, your details.** Who this is for, what the assistant should be called, your role, town, hours, WhatsApp number. Business mode also asks about payment and delivery.
- **Step 2, what you sell or know.** Products with prices, then the questions you answer daily, with the answers you want given.
- **Step 3, your assistant.** A live test chat, plus a copy-and-paste kit.

The assistant name is editable, so it can be Eddie, or named after the owner.

4. What you get out

- A test chat that behaves like WhatsApp, so an owner can be convinced before paying.
- Greeting message, sent automatically to anyone who messages first.
- Away message, so customers get an answer outside opening hours instead of silence.
- Quick replies: price list, how to pay, delivery rules, how to order. Personal mode gets call back, send details and busy now.
- Download my kit, the whole set as one text file.
- Open my chat link, a wa.me link for a flyer, Instagram bio or WhatsApp status.

Everything is copy-paste into the free WhatsApp Business app under Settings, then Business tools. No developer, no API, no monthly fee from Meta.

5. The to-do list

Second tab. Add a task, tick it, delete it, clear finished ones. A progress bar shows the day. Tasks stay on the device, no account needed.

This is what makes Eddie more than a reply generator: it is the owner's working desk.

6. Categories

Around 120 roles: retail and trade, engineering (chemical, civil, mechanical, electrical, electronics, software, petroleum, gas, mining, agricultural, structural, environmental, biomedical, mechatronics, computer,

telecommunications, metallurgical, industrial, production, water and sanitation, geotechnical, marine, automotive, aeronautical), law and medicine, education, technology and creative work, health and wellness, transport and logistics, faith and community groups, and personal use.

7. Privacy

- Everything is saved in the browser on that device. No account, no server database.
- No customer conversation is stored anywhere.
- Nothing is sent to any outside service unless the owner deliberately switches AI mode on with their own key.

Under the NDPA, the safest way to protect customer data is to never collect it.

8. Optional AI mode

Under Advanced, an owner can paste an OpenAI-compatible endpoint, model name and key (OpenAI, Groq or similar). Questions outside the script then go to that model, with the real prices and rules passed in as facts.

- Scripted answers always come first, so a price is never invented.
- For a paying client, leave AI mode off unless you control the billing. Scripted replies are free, instant and always correct.

9. What Eddie does not do

- It does not send WhatsApp messages by itself. That needs the Meta WhatsApp Cloud API and a verified business account.
- It does not sync between devices. Saved per browser.
- It does not take payments. It only explains how to pay.
- It does not handle voice notes or images from customers.

10. How it is sold

- Setup: N180,000 per business, including filling everything in with them and testing it live.
- Monthly: N25,000 for price, hours and answer updates, plus new quick replies.
- Personal users: free, or a small one-off. They become the top of the funnel, since a shop owner's child often meets the tool first.
- The demo sells it. Sit with the owner, type like a customer, let them watch their own business answer.

11. Running and deploying

Eddie is one static HTML file, no build step and no dependencies.

- Open index.html in any browser to run it locally.
- Deploy with 'vercel deploy --prod' from the folder.
- No environment variables required.

12. Roadmap

- Meta WhatsApp Cloud API, so replies send themselves.
- Google Sheets logging through Composio, so every order lands in a sheet.
- Voice note replies in English and Ibibio.
- A landing page with prices, so it can be sold without a meeting.
- Igbo, Yoruba and Hausa reply sets.

13. Ownership

Built by EdIdiong Orok. Part of the EduRise family of products. Version 1.0, November 2026.
